

Name:

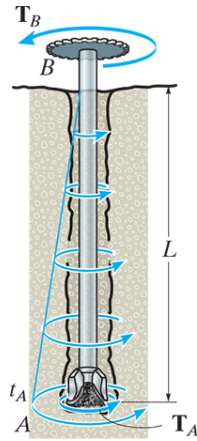

Exam 2 - version B

1. (20 pts.)

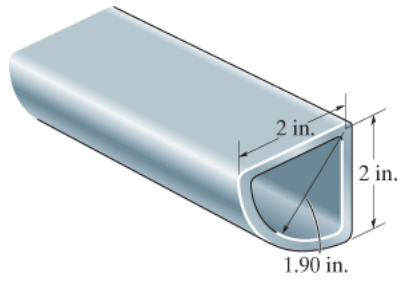

The rod shown has a modulus of $E = 15 \text{ ksi}$ and a coefficient of thermal expansion of $\alpha = 23/^\circ\text{F}$. The rod is 4 ft long at $T = 60^\circ\text{F}$ and the springs are compressed 0.5 in (each). Find the force in the rod when the temperature is $T = 120^\circ\text{F}$.

2. (30 pts.)

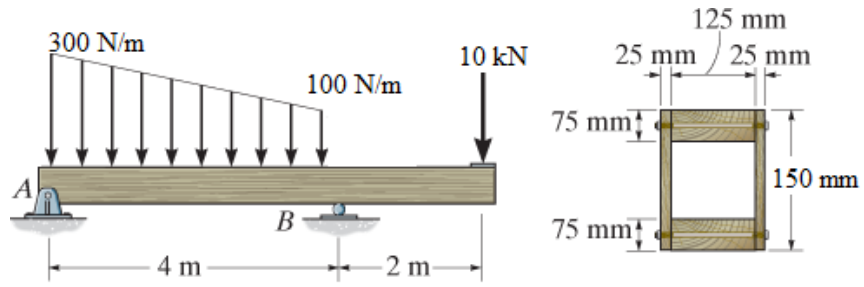

The motor drilling a well operates at a constant angular velocity, ω . There is a (constant) torsional resistance of T_A at the end and a linearly varying distributed resistance from friction of t_a as shown. Find the minimum torque, T_B of the motor and the maximum shear stress in the shaft, which is solid with a radius of r .

3. (20 pts.)

A torque of 3 kip.in is applied to the tube. If the wall thickness is $1/16$ in., find the average shear stress in the tube.

4. (30 pts.)

Find the maximum stress in the beam shown.
